

tuesday, 8 september, 2020 - session one

an introduction to complex challenges

course objectives

Understand what makes systems “complex” and the characteristics of complexity

Understand what makes challenges characterised by complexity different from other situations (for example technical problems)

Understand the differences between responses to complexity that are “fit for purpose” and those that are not.

what is complexity?

**three characteristics of
complexity**

emergent

adaptation

information

“pigeon”

vs

“rocket”

“complex”

vs

“non-complex”

these are two different paradigms for seeing the world

why do the paradigms we believe in matter?

axiom 1

paradigms are built from practices

axiom 1

paradigms are built from practices ;

**practices are built from tools, processes, spaces, ingredients,
and customs**

axiom 2

you cannot “practice” two contradictory paradigms at the same time ie. the world is both flat and a sphere

how do I sail a boat?

how do I sail a boat?
if I believe the world is flat?

how do I sail a boat?
if I believe the world is a sphere?

how do I sail a boat?

**your practice is different depending on
the paradigm you believe in**

axiom 3

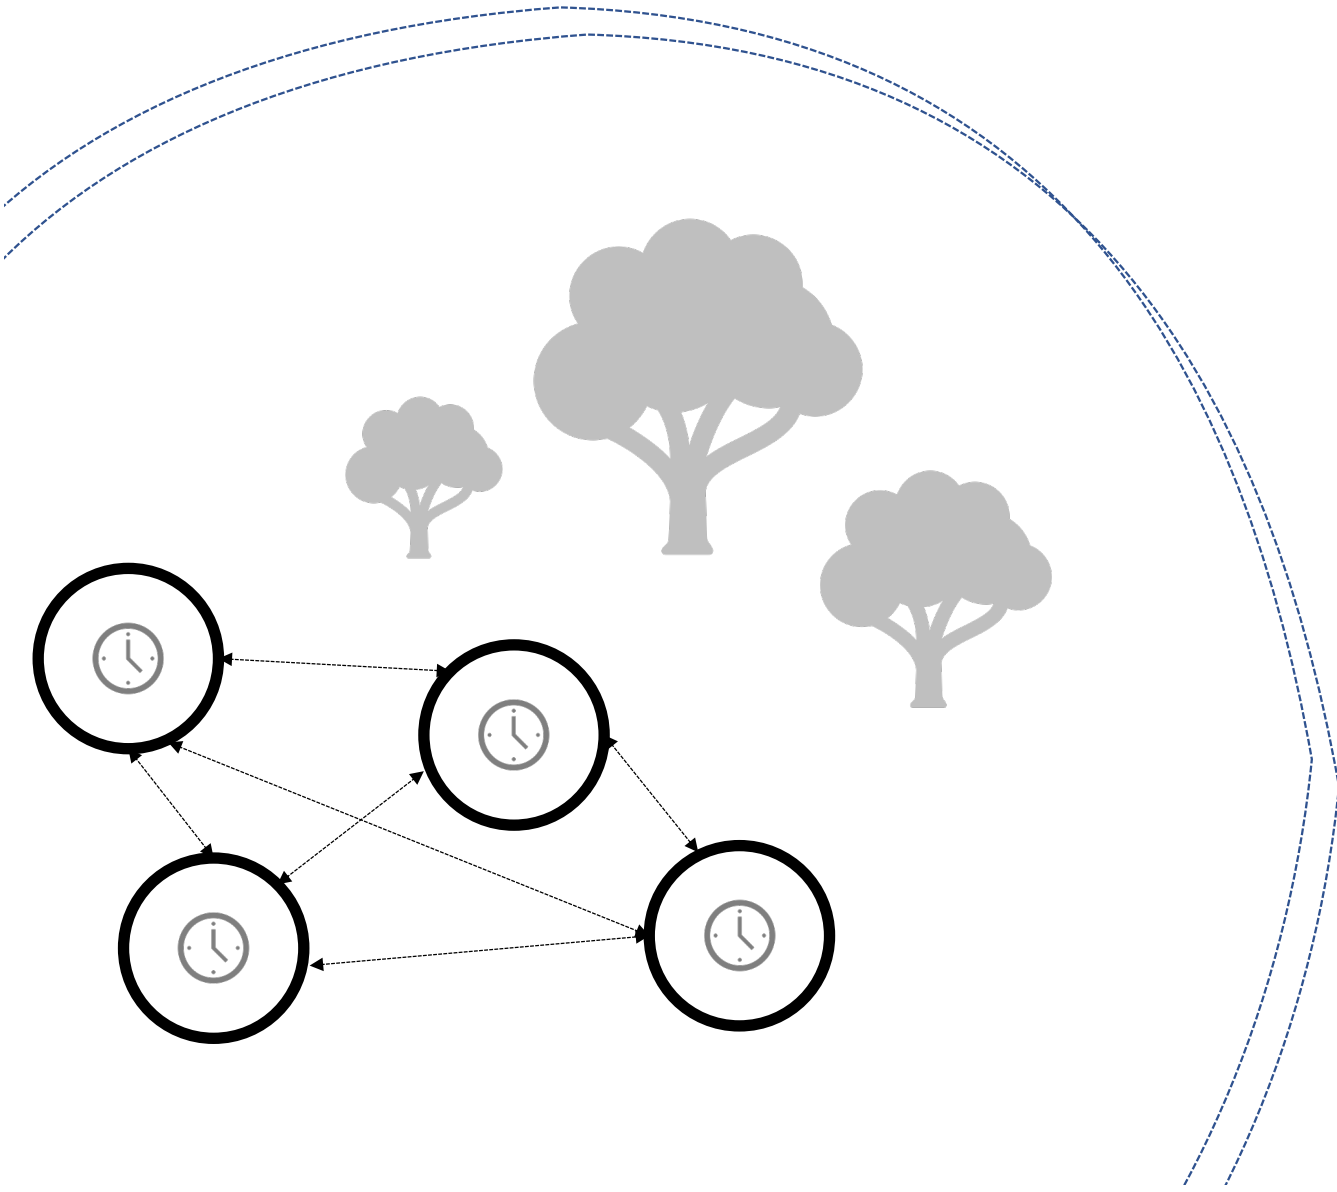

non-complex systems are always part of complex systems

but complexity is increasing

but complexity is increasing as non-complex systems grow

what is does it mean? what is at stake?

what happens when we ignore axiom 3?

non-complex systems are always part of complex systems

the probability of catastrophic failure grows

the probability of catastrophic failure grows
how? why?

**“[In a crisis] We don't rise to the level of our expectations,
we fall to the level of our training.”**

- Archilochus

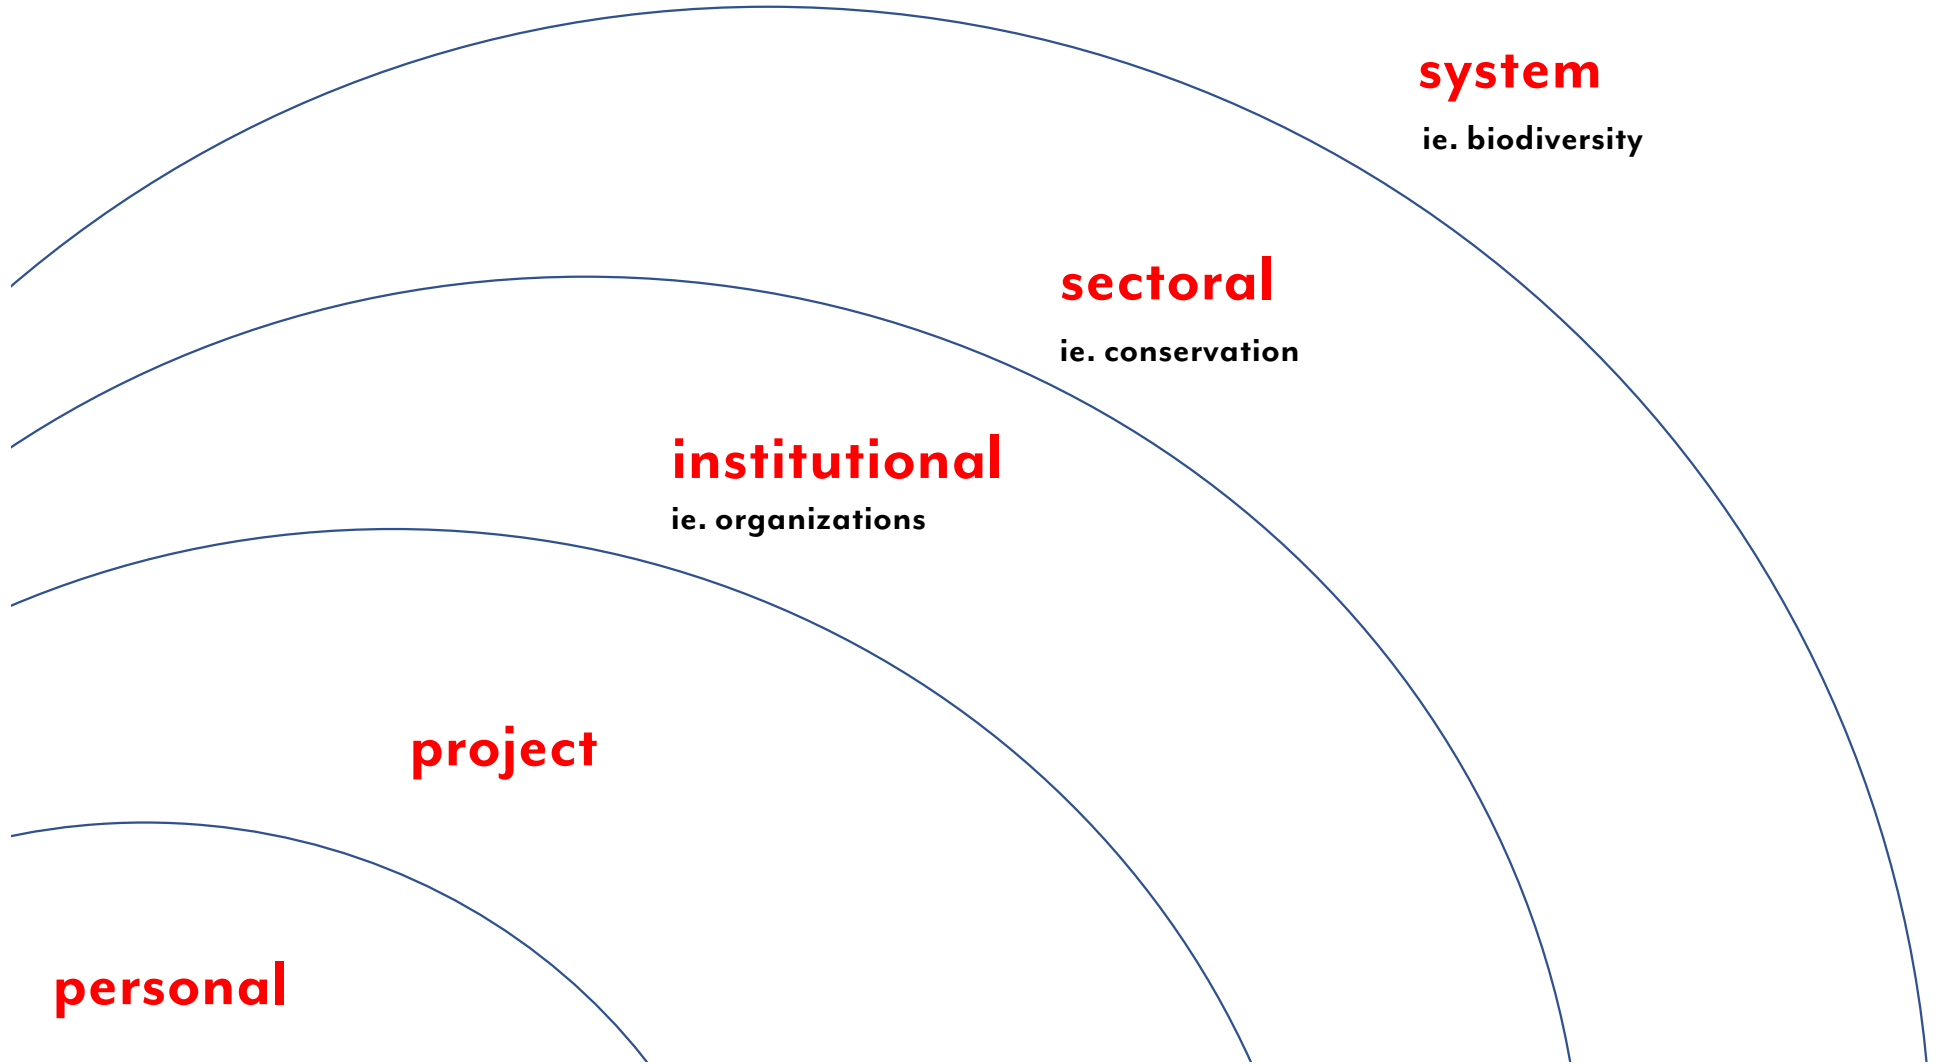

personal

project

institutional

sectoral

system

personal

project

institutional
ie. organizations

sectoral
ie. conservation

system
ie. biodiversity

axiom 3

non-complex systems are always part of complex systems

axiom 4

we adapt and learn our way into catastrophic failure

how?

demand for multiple forms of capital **increases**

(natural resources, infrastructure, services)

our ability to supply demand **decreases**

Figure 1: World Renewable Internal Freshwater Resources Per Capita vs World Population Density
 Source: Data from World Bank

— Agriculture, value added (% of GDP)
 — Yemen Population

Figure 2: Yemen Population vs Agriculture Value Added
 Source: Data from World Bank

Figure 3: UK Population vs Available Hospital Beds
 Source: Data from World Bank

Discuss in small groups, instances, where you see in systems you're a part of, demand increasing while supply is constant or declining...

session #2 avoiding catastrophic failure in complex systems

thursday, 10 september, 2020 - session two

an introduction to complex challenges

session #2 avoiding catastrophic failure in complex systems

**desired future
state**

current realities

**undesirable
future state**

**desired future
state**

how do we
get there?

how do we
avoid this?

**undesirable
future state**

we are here

current realities

how do we get there? how do we avoid the undesirable?

two approaches

the dominant response = strategic planning 🕒

**desired future
state**

current realities

**undesirable
future state**

current realities

phase 1

phase 2

phase 3

desired future state

undesirable future state

strategic planning aims for optimisation

**optimisation as a strategy in situations of diverging supply +
demand curves does not work**

(if we can get gravity wrong for 20 centuries,
shouldn't we consider possibility that we've gotten
strategic planning wrong?)

the culture of strategic planning is not fit for purpose

strategic planning in complexity is malpractice
just don't do it

axiom 3

non-complex systems are always part of complex systems

axiom 4

we adapt and learn our way into catastrophic failure

one day at a time

axiom 5

**if demand is increasing and supply is constant or declining
in a system, it is heading for catastrophic failure**

what is a better way?

a better response = **the prototyping paradigm**¹

(1) Note the “prototyping paradigm” is different from “prototyping processes”

axiom 6

there are multiple pathways to desirable future system states but they are all emergent (unpredictable)

**desired future
state**

**undesirable
future state**

current realities

axiom 7

we cannot see very clearly into the future

axiom 7

we cannot see very clearly into the future

we live in an era of the law of regression to the tail

**desired future
state**

**undesirable
future state**

current realities

we don't see the pathway as a whole

we don't see the pathway as a whole

we have a very partial view

we don't see the pathway as a whole

we have a very partial view, the journey is unpredictable

**desired future
state**

**undesirable
future state**

current realities

**think of a good journey you went on, think of a bad journey
what were the differences?**

“... the future is a teenage crackhead who makes shit up as he goes along.” – Chuck Klosterman

so what do we do then?

axiom 8

**test as many pathways to desirable systems states
as possible - the more we test, the more likely we are to
find a way through**

**desired future
state**

current realities

**undesirable
future state**

**desired future
state**

current realities

**undesirable
future state**

Axiom 9

**be disciplined when testing in complex systems,
draw boundaries (including temporal), be frugal
in testing (jugaad innovation)**

**desired future
state**

**undesirable
future state**

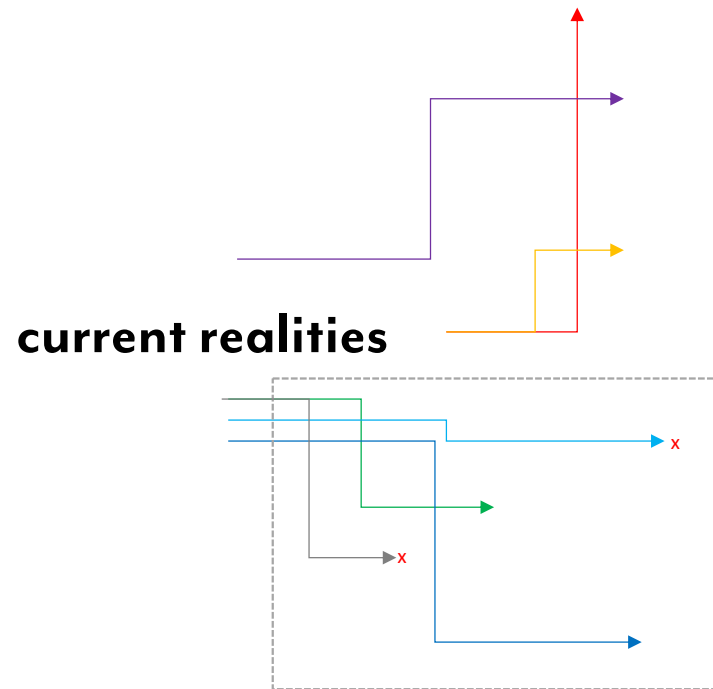

axiom 10

**“effective” practice in a complex system is reflexive
+ contextual**

axiom 10

**“effective” practice in a complex systems is reflexive
+ contextual - there is no such thing as “best practice”**

**desired future
state**

**undesirable
future state**

**desired future
state**

current realities

**undesirable
future state**

axiom 10

effective practice in complex systems is reflexive + contextual

“best practice” is an oxy-moron

axiom 11

the real innovation in complex systems are teams (not plans)

the best teams are the product of reflexive practice

axiom 12

effective strategy in complex systems is a practice

it is about what you actually do (not what you might do)

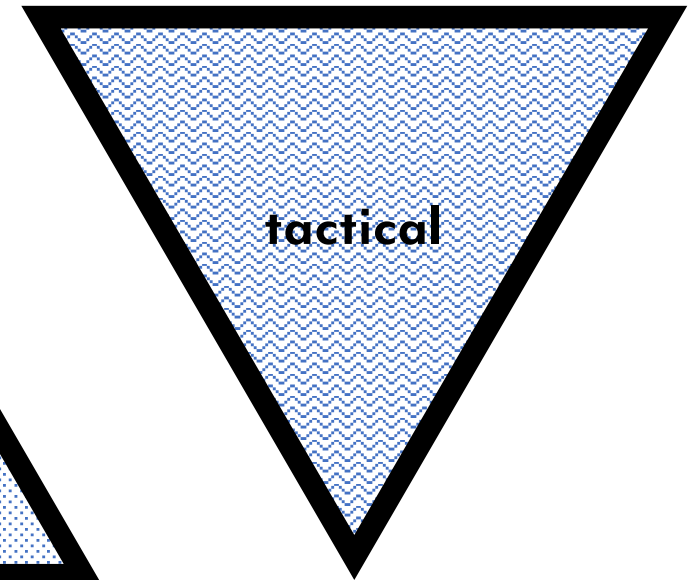

the three practices of effective strategy

strategy as story-telling

strategy as action

strategy as inner-game

the twelves axioms of complex challenges

axiom 1

paradigms are built from practices ;

**practices are built from tools, processes, spaces, ingredients,
and customs**

axiom 2

you cannot “practice” two contradictory paradigms at the same time ie. the world is both complex and non-complex

axiom 4

**we adapt and learn our way into catastrophic failure
one day at a time**

axiom 5

**if demand is increasing and supply is constant or declining
in a system, it is heading for catastrophic failure**

axiom 6

there are multiple pathways to desirable future system states but they are all emergent (unpredictable)

axiom 7

we cannot see very clearly into the future

we live in an era of the law of regression to the tail

axiom 8

**test as many pathways to desirable system states
as possible - the more we test, the more likely we are to
find a way through**

axiom 9

**be disciplined when testing in complex systems,
draw boundaries (including temporal), be frugal
in testing (jugaad innovation)**

axiom 10

effective practice in complex systems is reflexive + contextual

“best practice” is an oxy-moron

axiom 11

the real innovation in complex systems are teams (not plans)

the best teams are the product of reflexive practice

axiom 12

**effective strategy in complex systems is a practice
it is about what you actually do (not what you might do)**

foundations of complexity

part one / an introduction to complex challenges

part two / an introduction to effective strategy

part three / an introduction to multiple capitals
